

## Break the Paper Cycle

It's estimated that the average office worker uses 10,000 sheets of copy paper each year. Given that a tree 7-8 inches in diameter and 40 feet tall produces 17 reams of copy paper, a single office worker is responsible for consuming 1.17 trees each year. Multiply that by the number of office workers in the world, and the impact of paper production, consumption and disposal on our environment is staggering.

Laserfiche® digital document management solutions helps organizations shrink their carbon footprint by reducing paper consumption, eliminating the expense of distributing paper documents and saving energy resources. With Laserfiche, you work with digital images of scanned paper or electronic files, instead of copying, mailing and storing paper. Staff easily access the same files simultaneously—something that's impossible with paper—improving communication and collaboration and enabling better decision making.

Organizations that use Laserfiche document management solutions to break the paper cycle—saving the time, money and staff resources that enable them to gain a competitive edge include all branches of the United States military, the Secret Service and the State Department; Fortune 1,000 companies, and other organizations in government, healthcare, finance, healthcare, education, construction, transportation, and more.
